

Method and Apparatus for Keeping Warm While in a Tree Stand

Abstract

5

An apparatus for keeping a person warm while in a stand having a base connected to a tree, including a generally tubular length of material having an open end and a closed end, wherein the closed end includes a fastener for securing the apparatus to the base of the stand. A user simply inserts one or both of his or her feet and legs through the open end of the apparatus and pulls the open end of the apparatus up to a desired height. The apparatus is maintained at the desired height by an elastic band extending around the circumference of the open end.
